

Some CSS Rules

Matt Price

Display and Visibility

- display: tells the browser how to manage the selected element in the document flow:
 - **block** means “give this element its own line,”
 - **inline** means “use the line (or box) that the parent element has already defined”
 - **none** means “just don’t use display this element at all” – it will be removed from the screen
- visibility: tells the browser to hide the text, but still **reserve the space that it would normally take up**

color and background-color

- `color` sets the text content color
- `background-color` sets the background color
- you can use the pre-defined named colors like white, black, magenta, fuchsia, etc
- or you can use rgb values (red, green, blue values between 0 and 255): `rgb(127, 127, 127)` is grey, for instance
- or you can use hex values: `#888888` is also grey

font-style and font-weight

- font-style can be set to `italic`
- font-weight can be set to `bold` or `normal`

Other Rules/values

- think about what effect you want to achieve
- then google around/ask in Slack about how to do it!
